

MIKE'S STORY

Mike B. has been a competitive powerlifter since his time in the military in the early 1980s. For decades, the gym was his second home. But over the years, the sport he loved wore his shoulders down.

"I've got Osteoarthritis, so it was going to get worse as I got older. A doctor told me I was going to need a shoulder replacement somewhere down the line, and I wasn't thrilled with that."

He continued to compete, but the pain became a constant opponent. He could still meet the standards, but it was a struggle. Faced with the inevitable, Mike began seriously researching his options—and what he found was discouraging. Traditional shoulder replacements came with lifelong, severe physical limitations that were completely incompatible with his lifestyle.

"I wasn't at all happy with anybody I had talked to... the amount of limits that those replacements put on what you can do physically, it just wasn't going to work for me. I was willing to put up with the pain because I was afraid I was going to be giving up so much. I wasn't willing to accept being limited to 20 or 50 pounds. I waited until I found the solution that made sense for me."

Mike refused to settle. His search for a better solution led him to Arthrosurface and the OVO-Motion® implant, a joint preservation system designed to restore natural shoulder motion without the extreme limitations of a traditional replacement.

His research paid off; the OVOMotion implant gave him the outcome he was looking for.

"I'm so glad I found you guys. I appreciate the product you have out there. It gave me the outcome I was looking for when other options didn't. I'm about 90% of what I was before surgery...but i'm 100% pain free doing everyday activities. I have your product in both shoulders!"

Mike's story is a powerful reminder that you don't have to accept the limits of traditional total shoulder replacement when you choose Arthrosurface.

Due to its general applicability, do not rely on information in this brochure to assess any particular patient condition. Individual results may vary. Seek professional medical advice; and don't disregard professional medical advice because of something you have read in this pamphlet.
